CERT Monthly Safety Tip

<u>Cybersecurity Tips</u>

Here are some ways to improve your digital security.

- **Install software updates on all devices when you get notified – they contain the latest security patches.**

- **Use strong passwords; avoid using the same one repeatedly; use a password manager to store them.**

- **When possible, add 2-factor (TFA) or multi-factor (MFA) authentication to your accounts.**

- **Don't click on any unfamiliar emails, texts, links, messages, or attachments. These could be phishing or smishing scams!**

- **Don't share any personal information on social media!**

- **Consider using a VPN (Virtual Private Network) instead of public Wi-Fi to protect your privacy by encrypting internet traffic and keeping your IP address anonymous.**
